

## Norman Thomas - Senior Engineer

My role at the stadium is to make sure that all information is smoothly transferred from the design team onto the new stadium site, through our team of engineers.

I am rather like a middle-man working between the designers and the construction team. It's not unusual to have up to six engineers at one time, all of whom have a team of labourers, ground workers and steel-erectors that work for each of them.

The engineers have their own sections on the site, as that way they know what they have got to do, rather than doing parts of each section.

These sections are:

- Bricklaying – to ensure walls are in the right place
- Mechanical Works of the stadium – making sure pipes and fittings go in the right place.
- West Stand delivery.
- North Stand delivery.
- Services and drainage.
- Station works at Falmer station.
